

Jiwei Yang

13005149668 | yangjiwei@tsinghua.vin | github.com/NoctYang | noctyang.github.io

Education

School of Vehicle and Mobility, Tsinghua University
Jointly Trained Student, Prof. Jun Li's Research Group

2025.11 - 2026.06

School of Information Science and Technology, Great Bay University
Visiting Student, YU Vision Group

2025.06 - 2025.08

School of Artificial Intelligence, Guangzhou Institute of Science and Technology
Bachelor's Degree in Software Engineering

2022.09 - 2026.06

Research Experience

Prof. Jun Li's Research Group, Tsinghua University
Research Assistant

2026.06 - Present

Research on action-oriented world models and autonomous driving planning; completed Auto-JEPA and SDRA, both submitted to AAAI 2027.

Center for Brain Inspired Computing Research (CBICR), Tsinghua University
Embodied Intelligence Algorithm Engineer

2025.08 - 2025.10

Explored multimodal perception, language understanding, and action planning through model and algorithm experiments in embodied intelligence.

Research Projects

• Auto-JEPA: A Latent World Model of Continuous Intent for End-to-End Autonomous Driving

First Author | Submitted to AAAI 2027 | arxiv.org/abs/2607.29031

- Proposed Auto-JEPA to learn continuous future driving intent via joint-embedding prediction, addressing reliance on dense future-scene prediction.
- Achieved **91.3 PDMS on NAVSIM v1** and **89.1 EPDMS on NAVSIM v2**.
- Semantic occlusion of dynamic traffic-participant regions induced 2.97 times the intent change caused by random occlusion.
- Occluding vehicles relevant to future driving significantly changed predicted intent and selected trajectories; occluding irrelevant vehicles left both largely unchanged.

• SDRA: Spatiotemporally Decoupled VLM-Enhanced Reinforcement Learning for Energy-Efficient Heavy-Vehicle Driving

First Author | Submitted to AAAI 2027

- Proposed a VLM-enhanced, spatiotemporally decoupled reinforcement learning framework for heavy vehicles in complex highway scenarios.
- Designed spatial and temporal agents for lane-level intent decisions and cruise-coast control, respectively. A VLM integrates road images and structured traffic states to provide scene understanding and energy-efficient driving triggers.
- Experiments using real heavy-vehicle data showed a 6.7% reduction in fuel consumption with optimized trajectories.

• OP-RTDETR: Real-Time Outdoor Parking Space Detection with Grouped Convolutions and Group-Level Contrastive Denoising

First Author | SCI Q2 Journal, Under Revision

- Proposed OP-RTDETR based on RT-DETR to improve the speed and accuracy of real-time outdoor parking space detection.
- Used a GC-VanillaNet grouped-convolution backbone for efficient inference, with group-level contrastive denoising and grouped one-to-many matching to improve accuracy.
- On PKLot, OP-RTDETR achieved higher inference speed and detection accuracy than the mainstream models evaluated.

• CHyFN: A Consistency-Aware Hybrid Feature Network for Robust Object Recognition in Complex Scenes

Co-first Author (Listed Second)

- Proposed a unified recognition framework for weakly discriminative features arising from background and instance similarity.
- Fused global structure and local texture features across diffusion timesteps; used contextual consistency to suppress spurious target-background correlations.
- Conducted experiments on camouflaged object detection, fine-grained image classification, and generated-image detection, achieving competitive localization and classification performance.

Research Interests

My research focuses on learning and reasoning about the real world with world models, particularly:

- Real-world dynamics and interactions:** Understanding how the world evolves and how agents interact, beyond predicting the next observation.
- Task-relevant latent representations:** Extracting goal-relevant features from observations while reducing the modeling of irrelevant changes during latent-space reasoning.

Honors and Awards

First Prize, Programming Finals, 5th National College Computer Ability Challenge

National-level Project Approval, Undergraduate Innovation and Entrepreneurship Training Program, 2024
